SUMMARY

The first step of prevention is the understanding of the mechanism of how parental migration “works”. For this purpose we have elaborated a theoretical model, called “A framework model of risk mitigation.”(Fig. 1)

Related to the prevention of the negative consequences caused by parents labor migration, it is necessary to mention that prevention implies the joint work of specialized teams within which social workers, psychologists, sociologists and lawyers are working altogether. Specialists have to be very attentive also towards those persons who take care of the children during parents are away (usually grandparents). Grandparents’ who overtake the role of the parents are exposed to huge responsibilities, towards which (having in mind their age, economical and health status) they may not respond optimally.

In spite of the fact that external migration of the Romanian workforce has brought very many positive incomes in terms of economical well-being, it is important not to forget its negative consequences.
